EPA Executive Summary

The National Biennial RCRA Hazardous Waste Report (Based on 1997 Data)

EXECUTIVE SUMMARY

The United States Environmental Protection Agency (EPA), in partnership with the States¹, biennially collects information regarding the generation, management, and final disposition of hazardous wastes regulated under the Resource Conservation and Recovery Act of 1976 (RCRA), as amended. The purpose of *The National Biennial RCRA Hazardous Waste Report (Based on 1997 Data)* is to communicate the findings of EPA's 1997 Biennial Reporting System (BRS) data collection efforts to the public, government agencies, and the regulated community.² The Report consists of six volumes:

- **Executive Summary** provides an overview of national hazardous waste generation and management practices;
- National Analysis presents a detailed look at waste-handling practices in the EPA
 Regions, States, and largest facilities nationally, including (1) the quantity of waste
 generated, managed, shipped and received, and imported and exported between
 States and (2) the number of generators and managing facilities;
- State Summary Analysis provides a two-page overview of the generation and management practices of individual States;
- State Detail Analysis is a detailed look at each State's waste handling practices, including overall totals for generation, management, and shipments and receipts, as well as totals for the largest fifty facilities;
- List of Large Quantity Generators identifies every hazardous waste generator in the United States that reported itself to be a large quantity generator in 1997; and
- List of Treatment, Storage, and Disposal Facilities identifies every hazardous
 waste manager in the United States that reported itself to be a treatment, storage,
 or disposal facility in 1997.

¹The term "State" includes the District of Columbia, Puerto Rico, Guam, the Navajo Nation, the Trust Territories, and the Virgin Islands, in addition to the 50 United States.

²Some respondents from the States of Georgia and Connecticut submitted Confidential Business Information (CBI) pursuant to §40 CFR 260.2(b). While not included in any public BRS database, CBI has been incorporated into the *Executive Summary* and *National Analysis* volumes of this Report wherever possible. Where CBI has been omitted from these volumes, a footnote has been provided.

RCRA HAZARDOUS WASTE

Throughout this Report, the term RCRA hazardous waste refers to solid waste assigned a Federal Hazardous Waste Code and regulated by RCRA. Some States elect to regulate wastes not regulated by EPA; these wastes are assigned State Hazardous Waste Codes and are not included in this Report. The reader can find more detailed explanations in the *RCRA Orientation Manual* (http://www.epa.gov/epaoswer/general/orientat/) and in the Code of Federal Regulations in 40 CFR Parts 260 and 261 (http://www.epa.gov/docs/epacfr40/chapt-I.info/subch-I/). Please refer to Appendix E of this Report for a complete list of EPA Hazardous Waste Codes used by the regulated community for their 1997 Biennial Report submissions. Details about the information submitted by the regulated community can be found in the 1997 Hazardous Waste Report Instructions and Forms (http://www.epa.gov/epaoswer/hazwaste/data/brsforms.htm).

CHANGES TO 1997 BIENNIAL REPORTING REQUIREMENTS AND THE NATIONAL BIENNIAL REPORT DATA PRESENTED IN THIS REPORT

In accordance with EPA's efforts to reduce the record keeping and reporting burden on the regulated community, EPA streamlined the Federal data collection forms (1997 Hazardous Waste Report Instructions and Forms) for the 1997 Biennial Report cycle by eliminating the Process System (PS) Form. EPA would like to caution all readers of this Report that the change to eliminate the PS Form, along with the changes to the reporting requirements for aqueous wastes, commonly called wastewaters, managed in treatment systems regulated by the Clean Water Act (CWA) and not by the Resource Conservation and Recovery Act (RCRA), will make cursory comparisons of the 1997 National Biennial Report to earlier National Reports misleading.

Wastewaters are defined for biennial reporting as wastes that have a particular form and/or are managed on-site or off-site in treatment systems typically used to manage wastewater. All wastes bearing one of the following wastewater Form Codes (B101-102; B105, B110-116) and/or System Type Codes (M071-079; M081-085, 089; M091-094, 099; M121-125,

129; M134-136) are excluded from the National Report data and the 1997 National Biennial Report, with one exception: wastewaters managed by System Type Code M134 (Deepwell/Underground Injection) are included in the 1997 National Biennial Report. Refer to Appendix C and D for complete descriptions of the Form Codes and System Type Codes referenced above.

In previous National Reports, the PS Form was used to separate and exclude from the National Report data all wastes going to on-site treatment systems exempt from RCRA permitting requirements. For the 1997 National Biennial Report, EPA included all non-wastewater data and excluded all wastewater data. The wastewater data was excluded regardless of whether the wastes were managed in RCRA permitted systems prior to management in on-site or off-site treatment systems exempt from RCRA permitting requirements. This is significant, because historically EPA has included only those wastes managed in units subject to RCRA permitting requirements in the National Biennial Reports. EPA does not believe the inclusion of all non-wastewaters will distort the RCRA hazardous waste management picture presented in this Report, because only a small volume of non-wastewaters are managed in treatment systems exempt from RCRA permitting requirements.

RCRA HAZARDOUS WASTE GENERATION

RCRA hazardous waste generation information is obtained from data reported by RCRA large quantity generators (LQGs). A generator is defined as a Federal large quantity generator if:

- the generator generated in any single month 1,000 kg (2,200 pounds or 1.1 tons) or more of RCRA hazardous waste; or
- the generator generated in any single month, or accumulated at any time, 1 kg (2.2 pounds) of RCRA acute hazardous waste; or
- the generator generated, or accumulated at any time, more than 100 kg (220 pounds) of spill cleanup material contaminated with RCRA acute hazardous waste.

All generators that reported LQG status in 1997 are required to provide EPA with 1997 waste generation and management information. It is important to note that the LQGs identified in this Report have been included based on the most current information made available to EPA by the States. Both EPA and the States have made a significant effort to ensure the accuracy of this data. However, the LQG counts may include some generators that, when determining whether they were LQGs, used a lower State-defined threshold for LQGs, counted wastes regulated only by their States, or counted wastes exempt from Federal regulation.

To help provide a more accurate picture of hazardous waste generation in the United States, EPA requests specific waste generation information from LQGs. For each RCRA hazardous waste generated, LQGs are required to provide a waste description, the applicable Federal Hazardous Waste Codes that most accurately represent the waste generated, and the quantity of waste generated.

In 1997, 20,316 LQGs reported they generated 40.7 million tons of RCRA hazardous waste. When comparing the 1995 National Biennial Report with the 1997 Report, the number of LQGs decreased by 551, and the quantity of hazardous waste generated decreased by 173 million tons or 81%. The decrease in national hazardous waste generation is due in large part to the exclusion of wastewaters from the 1997 national reporting logic. For a more detailed description of the wastewater exclusion, please refer to the section of the *Executive Summary* entitled "Changes to 1997 Biennial Reporting Requirements and the National Biennial Report Data Presented in this Report."

The wastewater exclusion will make cursory comparisons between the 1997 National Biennial Report and earlier National Reports misleading. To facilitate an accurate comparison, Appendix B of the *National Analysis* provides the 1995 National Biennial Report data *excluding* wastewater (i.e., the data was compiled using the same national reporting logic used to exclude wastewater data from the 1997 National Report). As presented in Exhibit B.1, 36.3 million tons

of non-wastewater wastes were generated in 1995; therefore, a more accurate picture of the change in national hazardous waste generation between 1995 and 1997 is an increase of 4.4 million tons or 11%. Much of this increase resulted from a change in a few generators' wastewater management practices. In 1995, a few generators reported managing wastewaters in treatment systems exempt from RCRA permitting requirements, and, in accordance with the 1995 national reporting logic, these exempt wastewaters were excluded from the 1995 National Biennial Report. In 1997, the same generators reported managing these same wastewaters in Deepwell/Underground Injection (M134), a treatment system included in the 1997 National Biennial Report.

As identified in Exhibit 1, the five (5) States which contributed most to the national hazardous waste generation total in 1997 were Texas (19.0 million tons), Louisiana (4.6 million tons), Illinois (2.2 million tons), Ohio (1.7 million tons), and Mississippi (1.7 million tons). Together, the LQGs in these States accounted for 72% of the national total quantity generated.

RCRA HAZARDOUS WASTE MANAGEMENT

RCRA hazardous waste management information is obtained from data reported by active, permitted RCRA treatment, storage, or disposal facilities (TSDs). A TSD is defined as any facility which treats, stores, or disposes of RCRA hazardous waste, regardless of the quantity managed. Only wastes that were treated or disposed of in 1997 are included in the management quantities in this Report. Wastes generated and subsequently stored in 1997 are *not* included in the management quantities in this Report.

To help provide a more accurate picture of hazardous waste management practices in the United States, EPA requests specific waste management information from TSDs. For each RCRA hazardous waste managed, TSDs are required to provide the quantity of waste managed and the System Type Code which represents the management method used to manage the waste.

It is important to note that the total quantity of RCRA hazardous waste generated is less than the total quantity managed. Some of the reasons for this variance include: wastes generated during non-reporting years but shipped and treated or disposed during a reporting year and wastes received for management from generators in foreign countries.

In 1997, 2,025 TSDs reported they managed 37.7 million tons of RCRA hazardous waste. Of the 2,025 facilities, 1,078 were storage-only facilities. When comparing the 1995 National Biennial Report with the 1997 Report, the number of TSDs increased by 42, and the total quantity of hazardous waste managed decreased by 170.5 million tons or 82%. This decrease was largely attributable to the exclusion of wastewaters from the 1997 national reporting logic. For a more detailed description of the wastewater exclusion, please refer to the section of the *Executive Summary* entitled "Changes to 1997 Biennial Reporting Requirements and the Biennial Report Data Presented in this Report."

The wastewater exclusion will make cursory comparisons between the 1997 National Biennial Report and earlier National Reports misleading. To facilitate an accurate comparison, Appendix B of the *National Analysis* provides the 1995 National Biennial Report data *excluding wastewater* (i.e., the data was compiled using the same national reporting logic used to exclude wastewater data from the 1997 National Report.) As presented in Exhibit B.2, 35.1 million tons of non-wastewater wastes were managed in 1995; therefore, a more accurate picture of the change in national hazardous waste management between 1995 and 1997 is an increase of 2.6 million tons or 7%. A large portion of this increase resulted from a change in wastewater management practices. In 1995, a few TSDs reported managing wastewater in treatment systems exempt from RCRA permitting requirements, and, in accordance with the 1995 national reporting logic, these exempt wastewaters were excluded from the 1995 National Biennial Report. In 1997, the same TSDs reported managing these same wastewaters in Deepwell/Underground Injection (M134), a treatment system included in the 1997 National Biennial Report. Other factors contributing to the increase included increased waste management activities due to a landfill closing and remediation wastes from RCRA Corrective Action.

As identified in Exhibit 2, the five (5) States whose TSDs managed the largest quantities of hazardous wastes were Texas (17.4 million tons), Louisiana (4.5 million tons), Ohio (1.7 million tons), Mississippi (1.7 million tons), and Kansas (1.6 million tons). The TSDs in these five (5) States account for 71% of the national management total.

In 1997, *land disposal* accounted for 76% of the national non-wastewater management total. Land disposal methods include:

Deepwell/Underground Injection 26 million tons
Landfill 1.5 million tons
Surface Impoundment 1 million tons
Land Treatment/Application/Farming 19 thousand tons

¹Quantity managed by storage only is excluded.

Note: Columns may not sum due to rounding. Percentages do not include CBI data.

Recovery operations accounted for 10% of the national non-wastewater management total. Recovery operations include:

Fuel Blending 1.5 million tons

Metals Recovery (for Reuse) 1.1 million tons

Solvents Recovery 617 thousand tons

Other Recovery 443 thousand tons

Thermal treatment accounted for 9% of the national non-wastewater management total. Thermal treatment units include:

Energy Recovery (for Reuse as Fuel) 1.7 million tons

Incineration 1.7 million tons

The remaining non-wastewater management quantities (5%) were managed in *other treatment and disposal units*, including:

Stabilization 1.4 million tons

Sludge Treatment 411 thousand tons

Other Disposal (Specified in Comments) 251 thousand tons

RCRA HAZARDOUS WASTE SHIPMENTS AND RECEIPTS

RCRA hazardous waste shipment information is obtained from data reported by both RCRA LQGs and RCRA TSDs. To help provide a more accurate picture of hazardous waste shipments in the United States, EPA requests specific shipment information. For each waste shipped, LQGs and TSDs are required to provide a waste description, the applicable Federal

Hazardous Waste Codes, the quantity of waste shipped, and the EPA Identification Number of the receiving facility. All RCRA non-wastewater shipments reported by RCRA LQGs and TSDs are included in the waste shipment quantities in this Report, even if the waste was shipped to a transfer facility. In some instances, waste is transferred within a physical location that has more than one EPA Identification Number. These waste transfers are treated as shipments.

RCRA hazardous waste receipt information is obtained from data reported by RCRA TSDs. To help provide a more accurate picture of hazardous waste receipts in the United States, EPA requests certain receipt information from TSDs. For each waste received, TSDs are required to provide a waste description, the applicable Federal Hazardous Waste Codes, the quantity of waste received, and the EPA Identification Number of the facility from which the waste was received. For each received waste which is subsequently managed, TSDs are required to provide the System Type Code which represents the management method used to manage the waste.

RCRA hazardous waste export quantities include wastes generated in one State and shipped to a receiver in a different State. Exports are calculated from information provided by waste shippers. RCRA hazardous waste imports include all wastes received by a State which differs from the State of origin. RCRA hazardous waste imports are calculated from information provided by RCRA TSDs.

In 1997, 18,029 shippers reported shipping 7.3 million tons of hazardous waste. When comparing the 1995 National Biennial Report with the 1997 Report, the number of shippers decreased by 2,468, and the quantity of waste shipped decreased by 3.3 million tons, a 31% decrease. Some of the decrease in the quantity of waste shipped may be attributable to the exclusion of wastewaters from the 1997 national biennial reporting logic. However, since wastewaters are typically managed on-site rather than shipped off-site for management, the decrease between 1995 and 1997 is more likely the result of other factors. For a more detailed description of the wastewater exclusion, please refer to the section of the *Executive Summary* entitled "Changes to 1997 Biennial Reporting Requirements and the National Biennial Report Data Presented in this Report."

The wastewater exclusion will make cursory comparisons between the 1997 National Reports and earlier National Reports misleading. To facilitate an accurate comparison, Appendix B of the *National Analysis* provides the 1995 National Report data *excluding wastewater* (i.e., the data was compiled using the same national reporting logic used to exclude wastewater data from the 1997 National Biennial Report). As presented in Exhibit B.3, 6.2 million tons of non-wastewater wastes were shipped in 1995; therefore, a more accurate picture of the change in national hazardous waste shipments between 1995 and 1997 is a decrease of 1.1 million tons or 15%.

Of the 7.3 million tons of RCRA hazardous waste shipped in 1997, 4.4 million tons of waste were **exported** from the State in which they were generated to other States. When comparing the 1995 National Biennial Report with the 1997 Report, the quantity of waste exported decreased by 924 thousand tons or 17%. Some of the decrease in the quantity of waste exported may be attributable to the exclusion of wastewaters from the 1997 national reporting logic. However, since wastewaters are typically managed on-site rather than shipped off-site for management, the decrease between 1995 and 1997 is more likely the result of other factors.

The wastewater exclusion will make cursory comparisons between the 1997 National Biennial Report and earlier National Reports misleading. To facilitate an accurate comparison, Appendix B of the *National Analysis* provides the 1995 National Report data *excluding wastewater* (i.e., the data was compiled using the same national reporting logic used to exclude wastewater data from the 1997 National Biennial Report). As presented in Exhibit B.5, 3.6 million tons of non-wastewater wastes were exported to other States in 1995; therefore, a more accurate picture of the change in national hazardous waste exports between 1995 and 1997 is an increase of 753 thousand tons or 17%.

In 1997, 543 TSDs reported receiving 8 million tons of RCRA hazardous waste. When comparing the 1995 National Biennial Report with the 1997 Report, the number of TSDs receiving waste decreased by 101, and the quantity of waste received decreased by 1.3 million tons or 14%. Some of the decrease in the quantity of waste received may be attributable to the exclusion of wastewaters from the 1997 national reporting logic. However, since wastewaters are typically managed on-site rather than shipped off-site for management, the decrease between 1995 and 1997 is more likely the result of other factors.

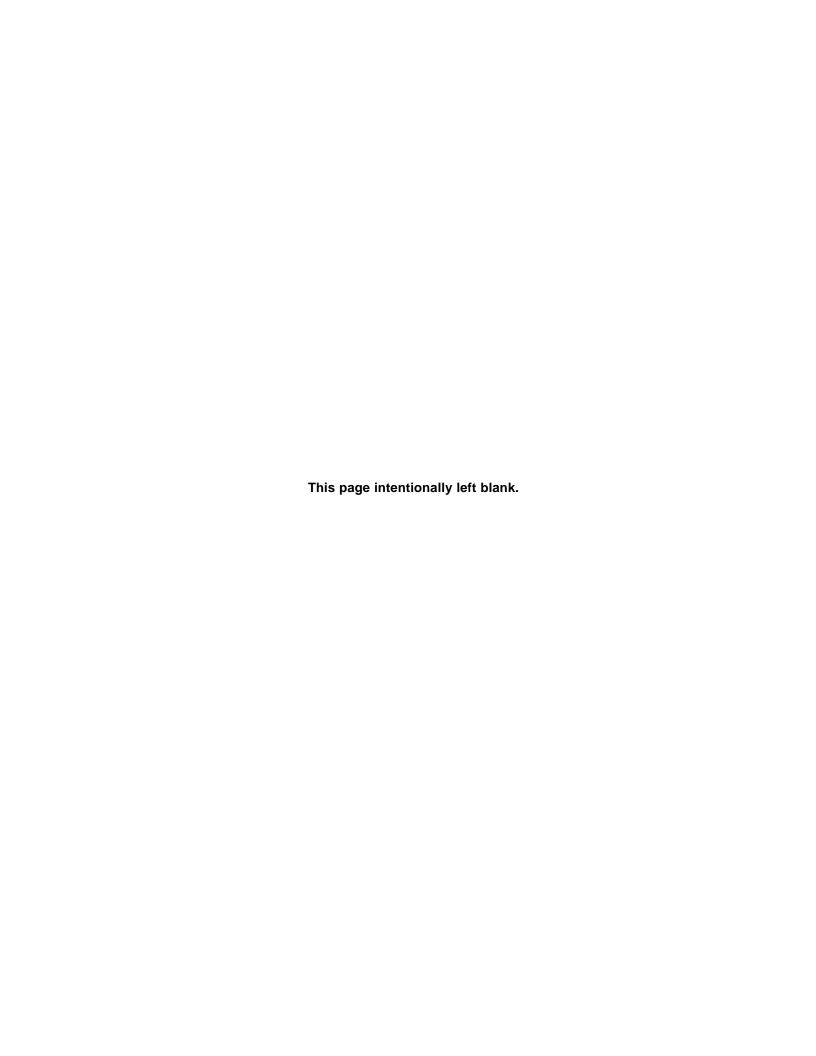

The wastewater exclusion will make cursory comparisons between the 1997 National Biennial Report and earlier National Reports misleading. To facilitate an accurate comparison, Appendix B of the *National Analysis* provides the 1995 National Report data *excluding wastewater* (i.e., the data was compiled using the same national reporting logic used to exclude wastewater data from the 1997 National Biennial Report). As presented in Exhibit B.4, 7.9 million tons of non-wastewater wastes were received in 1995; therefore, a more accurate picture of the change in national hazardous waste receipts between 1995 and 1997 is an increase of 87 thousand tons or 1%.

Of the 8 million tons of RCRA hazardous waste received in 1997, 4 million tons of waste were **imported** from other States. When comparing the 1995 National Biennial Report with the 1997 Report, the quantity of waste imported decreased by 1.9 million tons or 32%. Some of the decrease in the quantity of waste imported may be attributable to the exclusion of wastewaters from the 1997 national reporting logic. However, since wastewaters are typically managed on-site rather than shipped off-site for management, the decrease between 1995 and 1997 is more likely the result of other factors.

The wastewater exclusion will make cursory comparisons between the 1997 National Report and earlier National Reports misleading. To facilitate an accurate comparison, Appendix B of the *National Analysis* provides the 1995 National Report data *excluding wastewater* (i.e., the data was compiled using the same national reporting logic used to exclude wastewater data from the 1997 National Biennial Report). As presented in Exhibit B.5, 5.1 million tons of non-wastewater wastes were imported in 1995; therefore, a more accurate picture of the change in national hazardous waste imports between 1995 and 1997 is a decrease of 1.1 million tons or 22%.

WHERE TO OBTAIN ADDITIONAL INFORMATION

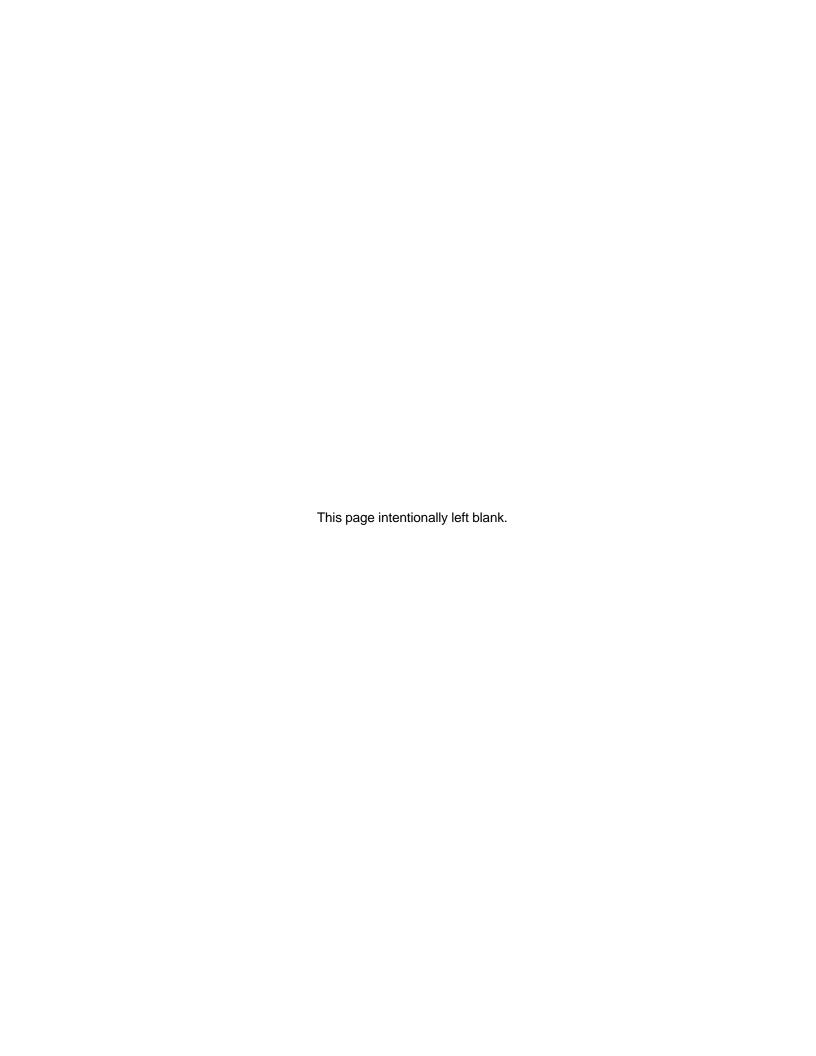

All volumes of *The National Biennial RCRA Hazardous Waste Report (Based on 1997 Data)* and the 1997 Biennial Reporting System (BRS) data files can be accessed via the Internet at http://www.epa.gov/epaoswer/hazwaste/data/#brs or purchased from the National Technical Information Service (NTIS) at (703) 487-4650.

EPA National Analysis

The National Biennial RCRA Hazardous Waste Report (Based on 1997 Data)

NATIONAL BIENNIAL RCRA HAZARDOUS WASTE REPORT

The United States Environmental Protection Agency (EPA), in partnership with the States¹, biennially collects information regarding the generation, management, and final disposition of hazardous wastes regulated under the Resource Conservation and Recovery Act of 1976 (RCRA), as amended. The purpose of this Report is to communicate the findings of EPA's 1997 Biennial Reporting System (BRS) data collection efforts to the public, government agencies, and the regulated community.²

1.0 WASTE GENERATION

The following section provides an overview of the 1997 RCRA hazardous waste generation data through a series of exhibits and textual summaries. For a complete description of this section's contents, please refer to the *Executive Summary* sections entitled "RCRA Hazardous Waste" and "RCRA Hazardous Waste Generation."

In 1997, 20,316 large quantity generators (LQGs) reported they generated 40.7 million tons³ of hazardous wastes regulated by RCRA. When comparing the 1995 National Biennial Report with the 1997 Report, the number of LQGs decreased by 551, and the quantity of hazardous waste generated decreased by 173 million tons or 81%. This decrease in national hazardous waste generation is due in large part to the exclusion of wastewaters from the 1997 national reporting logic. For a more detailed description of the wastewater exclusion, please refer to the section of the *Executive Summary* entitled "Changes to 1997 Biennial Reporting Requirements and the National Biennial Report Data Presented in this Report."

The wastewater exclusion will make cursory comparisons between the 1997 National Biennial Report and earlier National Reports misleading. To facilitate an accurate comparison, Appendix B of this Report provides the 1995 National Biennial Report data excluding wastewater (i.e., the data was compiled using

The term "State" includes the District of Columbia, Puerto Rico, Guam, the Navajo Nation, the Trust Territories, and the Virgin Islands, in addition to the 50 United States.

² Some respondents from Georgia and Connecticut have submitted Confidential Business Information (CBI) pursuant to §40 CFR 260.2(b). While not included in any public BRS database, CBI has been incorporated into the *Executive Summary* and *National Analysis* volumes of this Report wherever possible. Where CBI has been omitted from these volumes, a footnote has been provided.

 $^{^{3}}$ 1 Ton = 2,000 pounds

the same national reporting logic used to exclude wastewater data from the 1997 National Report). As presented in Exhibit B.1, 36.3 million tons of non-wastewater wastes were generated in 1995; therefore, a more accurate picture of the change in national hazardous waste generation between 1995 and 1997 is an increase of 4.4 million tons or 11%. Much of this increase resulted from a change in a few generators' wastewater management practices. In 1995, a few generators reported managing wastewaters in treatment systems exempt from RCRA permitting requirements, and, in accordance with the 1995 national reporting logic, these exempt wastewaters were excluded from the 1995 National Biennial Report. In 1997, the same generators reported managing these same wastewaters in Deepwell/Underground Injection (M134), a treatment system included in the 1997 National Biennial Report.

Exhibits 1.1, 1.2, and 1.3 present the number of LQGs and the quantity of RCRA hazardous waste generated by LQGs in each EPA Region⁴. LQGs in three (3) of the EPA Regions (Regions 6, 5, and 4) produced 87% of the 40.7 million tons generated nationally in 1997. LQGs in Region 6 generated 25 million tons (or 62% of the national total), LQGs in Region 5 generated 6.5 million tons (16%), and LQGs in Region 4 generated 3.7 million tons (9%).

As Exhibits 1.2 and 1.3 reveal, there is not necessarily a correlation between the Regions which generate the largest quantities of hazardous waste and the Regions with the greatest number of LQGs. In 1997, the Regions with the most LQGs were Region 5 (4,318 or 21% of the national total), Region 2 (3,699 or 18%), and Region 4 (2,899 or 14%). These three (3) Regions accounted for 54% of the total number of LQGs. While LQGs in Region 6 generated the largest percentage of hazardous waste (25 million tons), the Region ranked fifth in number of LQGs (1,971). Region 5 had the most LQGs (4,318), though the Region ranked second in hazardous waste generation (6.5 million tons). Region 8 had the fewest LQGs (351) and also generated the least amount of hazardous waste (178 thousand tons).

Appendix A includes a list of States by EPA Region.

Percentages do not include CBI data.

Exhibits 1.4, 1.5, and 1.6 present the number of LQGs and the quantity of RCRA hazardous waste generated by LQGs *in each State*. The five (5) States whose LQGs produced the largest amount of hazardous waste were Texas (19.0 million tons), Louisiana (4.6 million tons), Illinois (2.2 million tons), Ohio (1.7 million tons), and Mississippi (1.7 million tons). Together, the LQGs in these States accounted for 72% of the national total quantity generated.

The States with the most LQGs were New York (2,772), California (1,782), Ohio (1,271), Texas (1,219), Illinois (1,058), Pennsylvania (1,058), New Jersey (819), and Michigan (682). The LQGs in these States accounted for 52% of the total number of LQGs.

Exhibit 1.7 provides a list of the 50 largest generators in the nation. The listed generators produced 79% (32.1 million tons) of the national total. Seventeen (17) of the top 50 generators are located in Texas, the top-ranked State in hazardous waste generation. These 17 Texas LQGs accounted for 93% of the State's generation total and 44% of the national generation total. The five (5) LQGs in Louisiana, the State

ranked second in hazardous waste generation, accounted for 88% of the State's generation total and 10% of the national generation total. Eight (8) of the largest generators are located in Illinois, Ohio, and Mississippi, the States ranked third, fourth, and fifth, respectively, in hazardous waste generation. These LQGs accounted for 11% of the national total quantity generated.

Exhibit 1.8 illustrates the relationship between various hazardous waste generation quantity ranges and the number of generators that generated within each range. Most of the LQGs (13,476 generators or 66% of the national total) generated between 1.1 and 113.2 tons in 1997. Only 44 LQGs (less than 1% of all LQGs) generated within the top tier of hazardous waste generation, over 111,113.2 tons, but these few LQGs accounted for 78% of the national total quantity generated. Ninety-five percent (95%) of all LQGs generated 1,113 tons or less in 1997.

Exhibit 1.4 Quantity of RCRA Hazardous Waste Generated and Number of Hazardous Waste Generators, by State, 1997

Exhibit 1.8 Number of Large Quantity Generators by Generator Quantity Range, 1997*

Hazardous waste is categorized as either *characteristic* or *listed* waste. Both waste categories (and the subcategories of each) are specifically described in §40 CFR⁵ 261, and a list of EPA Hazardous Waste Codes is provided as Appendix E of this Report.

Characteristic wastes refer to any solid waste that exhibits one or more of the following characteristics, ignitability (D001), corrosivity (D002), or reactivity (D003), or contains toxic constituents in excess of Federal standards (D004 to D043).

An <u>ignitable</u> waste is a solid waste that exhibits any of the following properties:

- A liquid, except aqueous solutions containing less than 24 percent alcohol, with a flash point less than 60 degrees Celsius (140 degrees Fahrenheit).
- A nonliquid capable, under normal conditions, of spontaneous and sustained combustion.

-

CBI data excluded from exhibit.

Code of Federal Regulations.

- An ignitable compressed gas as defined by Department of Transportation (DOT) regulations.
- An oxidizer per DOT regulations.

A corrosive waste is a solid waste that exhibits the following properties:

- An aqueous material with pH less than or equal to 2, or greater than or equal to 12.5.
- A liquid that corrodes steel at a rate greater than 1/4 inch per year at a temperature of 55 degrees Celsius (130 degrees Fahrenheit).

A <u>reactive</u> waste is a solid waste that exhibits the following properties:

- Normally unstable and reacts violently without detonating.
- Reacts violently with water.
- Forms an explosive mixture with water.
- Contains cyanide or sulfide and generates toxic gases, vapors, or fumes at a pH of between 2 and 12.5.
- Capable of detonation if heated under confinement or subjected to a strong initiating source.
- Capable of detonation at standard temperature and pressure.
- Listed by DOT as Class A or B explosive.

Wastes with the toxicity characteristic are identified through failure of the Toxicity Characteristic Leaching Procedure Test (TCLP). A solid waste exhibits the toxicity characteristic if, using the TCLP or an equivalent method, the extract from a representative sample of the waste contains any of the contaminants D004 to D043 at a concentration equal to or greater than the value described in §40 CFR 261.24.

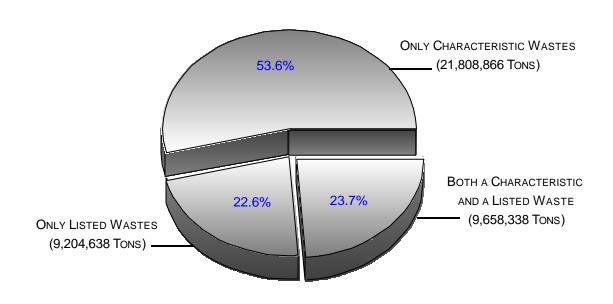

The term "listed waste" (F, K, P, and U codes) refers to waste that EPA has identified as hazardous as a result of its investigations of particular industries or because EPA has specifically recognized a commercial chemical waste's toxicity. A solid waste is a "listed" hazardous waste if it is named on one of three lists developed by EPA:

Non-specific source wastes ('F' wastes): These are generic wastes, commonly produced by
manufacturing and industrial processes. Examples from this list include spent halogenated solvents
used in degreasing, and wastewater treatment sludge from electroplating processes, as well as
dioxin wastes, most of which are acutely hazardous wastes due to the danger they present to human
health and the environment.

- Specific source wastes ('K' wastes): This list consists of wastes from specifically identified industries such as wood preserving, petroleum refining, and organic chemical manufacturing. These wastes typically include sludges, still bottoms, wastewater, spent catalysts, and residues, (e.g., wastewater treatment sludge from pigment production).
- Commercial chemical products ('P' and 'U' wastes): The third list consists of specific commercial chemical products, or manufacturing chemical intermediates. This list includes chemicals such as chloroform and creosote, acids such as sulfuric acid and hydrochloric acid, and pesticides such as DDT and kepone. The 'U' wastes include toxic chemicals while 'P' waste listings are reserved for acutely toxic chemicals.

Exhibits 1.9, 1.10, and 1.11 divide the 1997 national generation total according to the percentage of characteristic, listed, or a mixture of characteristic and listed. Wastes categorized as only characteristic wastes represented 54% (21.8 million tons) of the national generation total, while listed-only wastes comprised 23% (9.2 million tons), and wastes with both characteristic and listed waste codes constituted 9.7 million tons (24%) of the national total. Mixed wastes (wastes which have multiple characteristics, are listed on more than one list, or are both) represented 9.6 million tons of the national generation total in 1997.

Exhibit 1.9 Percentages of National Generation Total That Were Characteristic, Listed, or Both Characteristic and Listed Waste, 1997*

^{*} CBI data excluded from exhibit.

Exhibit 1.10 Tons of Generated Waste That Were Only Characteristic Waste, Only Listed Waste, or Both Characteristic and Listed Waste, 1997

| | | HAS K CODE | 2,141,796 | K WASTE W/ AT LEAST 1 CHAR | 6,804,882 |
| | | HAS P CODE | 41,606 | P WASTE W/ AT LEAST 1 CHAR | 177,675 |
| | | HAS U CODE | 922,626 | U WASTE W/ AT LEAST 1 CHAR | 1,751,411 |
| TOTAL | 10,554,821 | TOTAL | 2,199,061 | TOTAL | 9,658,338 |

¹ Listed wastes with ignitable, corrosive, reactive, D004-17 (Toxic), or D018-43 (Toxic) characteristics respectively may have other characteristics as well. Similarly, characteristic wastes that are also F, K, P, or U listed wastes respectively may be other listed wastes as well.

Note: All quantities are in tons.

Columns do not sum to total because wastes may be included in more than one category.

CBI data excluded from exhibit.

2.0 WASTE MANAGEMENT

The following section provides an overview of the 1997 RCRA hazardous waste management data through a series of exhibits and textual summaries. For a complete description of this section's contents, please refer to the *Executive Summary* sections entitled "RCRA Hazardous Waste" and "RCRA Hazardous Waste Management." Also, Appendix C provides a complete list of management systems and the System Type Codes used to identify them.

In 1997, 2,025 treatment, storage, or disposal (TSD) facilities reported they managed 37.7 million tons of hazardous waste through treatment, storage, or disposal. Of the 2,025 TSDs, 1,078 were storage-only facilities in 1997. When comparing the 1995 National Biennial Report with the 1997 Report, the number of TSDs increased by 42, while the quantity of hazardous waste managed decreased 170.5 million tons. This 82% decrease was largely attributable to the exclusion of wastewaters from the 1997 national reporting logic. For a more detailed description of the wastewater exclusion, please refer to the section of the *Executive Summary* entitled "Changes to 1997 Biennial Reporting Requirements and the National Biennial Report Data Presented in this Report."

The wastewater exclusion will make cursory comparisons between the 1997 National Biennial Report and earlier National Reports misleading. To facilitate an accurate comparison, Appendix B of this Report provides the 1995 National Biennial Report data *excluding wastewater* (i.e., the data was compiled using the same national reporting logic used to exclude wastewater data from the 1997 National Report). As presented in Exhibit B.2, 35.1 million tons of non-wastewater wastes were managed in 1995; therefore, a more accurate picture of the change in national hazardous waste management between 1995 and 1997 is an increase of 2.6 million tons or 7%. A large portion of this increase resulted from a change in wastewater management practices. In 1995, a few TSDs reported managing wastewaters in treatment systems exempt from RCRA permitting requirements, and, in accordance with the 1995 national reporting logic, these exempt wastewaters were excluded from the 1995 National Biennial Report. In 1997, the same TSDs reported managing these same wastewaters in Deepwell/Underground Injection (M134), a treatment system included in the 1997 National Biennial Report. Other factors contributing to the increase included increased waste management activities due to a landfill closing and remediation wastes from RCRA Corrective Action.

Exhibits 2.1, 2.2, and 2.3 present the quantity of RCRA hazardous waste managed and the number of TSDs *in each EPA Region*⁶. TSDs located in three (3) Regions managed 83% of the 37.7 million tons managed nationally in 1997. These Regions were Region 6 (23.5 million tons), Region 5 (4.8 million tons), and Region 4 (3.2 million tons). As would seem logical, Region 6, Region 5, and Region 4 were also the top-ranked Regions, respectively, in hazardous waste generation in 1997.

While TSDs in Region 6 managed the largest percentage of waste in the nation, the Region ranked fourth in the number of TSDs (271). The three (3) Regions with the most TSDs were Region 5 (447), Region 4 (341), and Region 9 (284). These three (3) Regions combined accounted for 53% of the total number of TSDs. Region 10 had the fewest TSDs (50).

-

⁶ Appendix A includes a list of States by EPA Region.

Exhibit 2.1 Number and Percentage of RCRA TSD Facilities and Total RCRA Hazardous Waste Quantity Managed, by EPA Region, 1997

¹Quantity managed only by storage is excluded.

Exhibits 2.4, 2.5, and 2.6 present the quantity of RCRA hazardous waste managed and the number of TSDs *in each State*. TSDs in Texas managed the largest amount of waste (17.4 million tons), followed by Louisiana (4.5 million tons), Ohio (1.7 million tons), Mississippi (1.7 million tons), and Kansas (1.6 million tons). Together, the TSDs in these States accounted for 71% of the national management total.

California reported the most TSDs (250), followed by Texas (135), Wisconsin (132), Michigan (113), North Carolina (100), Illinois (86), New Jersey (85), Missouri (83), and New York (73). TSDs in these States constituted 53% of the total number of TSDs. The Navajo Nation reported no TSDs. Vermont, Wyoming, South Dakota, the District of Columbia, Guam, and New Hampshire all reported having TSD facilities but zero management quantities. The TSDs in these States reported storage-only management or the management of wastewaters excluded from the 1997 national reporting logic.

Exhibit 2.7 presents the 50 largest RCRA hazardous waste management facilities in the United States in 1997. Collectively, these TSDs accounted for 84% of the national management total. The largest generator, E.I. Du Pont De Nemours & Co., in Victoria, Texas, also managed the most waste, 4.3 million tons.

Note: Columns may not sum due to rounding. Percentages do not include CBI data.

Changes to the 1997 Biennial Reporting requirements will make cursory comparisons of the 1997 National Biennial Report to earlier National Biennial Reports misleading. Refer to the Executive Summary (ES-2) for a complete explanation.

¹ Quantity managed only by storage is excluded.

Note: Column may not sum due to rounding.

Large TSDs in the five (5) States which managed the most waste, Texas, Louisiana, Ohio, Mississippi, and Kansas, also accounted for the majority of each State's management totals. Fifteen (15) Texas TSDs managed 45% of the national management total and 97% of the State's management total. The largest Louisiana facilities managed 11% of the national management total and accounted for 89% of the State's management total. The three (3) Ohio TSDs managed 77% of the hazardous waste managed in Ohio. In Mississippi, the two (2) largest TSDs managed 97% of the State's management total. The one (1) Kansas TSD managed nearly all of the waste managed in the State, 1 million tons or 92% of the State total.

Exhibits 2.8, 2.9, and 2.10 provide an overview of the various management methods and quantity of waste managed by each method. As stated earlier, all wastewaters were excluded from the 1997 National Report data, therefore, most management methods employed for managing the wastewater (including aqueous treatment units and direct discharge to sewer/POTW or to surface water under NPDES) have also been excluded from this Report. However, wastes managed in Deepwell/Underground Injection (M134) are included in this Report.

Land disposal accounted for 76% of the national non-wastewater management total. The land disposal units and quantity managed by method include:

Deepwell/Underground Injection 26 million tons
Landfill 1.5 million tons
Surface Impoundment 1 million tons
Land Treatment/Application/Farming 19 thousand tons

Recovery operations represented 10% of the national non-wastewater management total. The methods defined as recovery operations and the quantity managed by each method include:

Fuel Blending 1.5 million tons

Metals Recovery (for Reuse) 1.1 million tons

Solvents Recovery 617 thousand tons

Other Recovery 443 thousand tons

Exhibit 2.8 Quantity of RCRA Hazardous Waste Managed, by Management Method, 1997

| MANAGEMENT METHOD | SYSTEM TYPE CODE | TONS MANAGED ¹ | PERCENTAGE OF QUANTITY | NUMBER OF FACILITIES ² | PERCENTAGE OF FACILITIES ² |

¹ Facilities reporting storage only and their quantity managed are excluded.

² Column may not sum because facilities may have multiple handling methods.

Thermal treatment accounted for 9% of the national non-wastewater management total. Thermal treatment methods include:

Energy Recovery (for Reuse as Fuel) 1.7 million tons Incineration 1.7 million tons

The remaining non-wastewater management quantities (5%) were managed in *other treatment and disposal units*, including:

Stabilization 1.4 million tons
Sludge Treatment 411 thousand tons
Other Disposal (Specified in Comments) 251 thousand tons

Exhibits 2.11, 2.12, and 2.13 present the management methods used for treating or disposing of wastes received from off-site and the quantity managed by each method. In 1997, 6.8 million tons (18% of the national management total) of waste was received from off-site and subsequently managed on-site in treatment and disposal units. As stated earlier, all wastewaters were excluded from the 1997 National Report data, therefore, most management methods employed for managing the wastewater (including aqueous treatment units and direct discharge to sewer/POTW or to surface water under NPDES) have also been excluded from this Report. However, wastes managed in Deepwell/Underground Injection (M134) are included in this Report.

Recovery operations were used to manage 41% of the non-wastewater waste received from off-site and managed on-site. Recovery operations include:

Fuel Blending 1.3 million tons

Metals Recovery (for Reuse) 820 thousand tons

Solvents Recovery 531 thousand tons

Other Recovery 103 thousand tons

| TOTAL | | 6,810,921 | 100.0 | 310 | |

¹ Facilities reporting storage only and their quantity managed are excluded.

Land disposal units accounted for 21% of the national non-wastewater management total for waste received from off-site and subsequently managed on-site. Land disposal units include:

Landfill 947 thousand tons

Deepwell/Underground Injection 488 thousand tons

Thermal treatment also accounted for 21% of the national management total for waste received from off-site and subsequently managed on-site. Thermal treatment units include:

Energy Recovery (Reuse as Fuel) 901 thousand tons Incineration 532 thousand tons

² Column may not sum because facilities may have multiple handling methods.

Other treatment and disposal units were used to manage the remaining 17% of the national non-wastewater management total for wastes received from off-site and managed on-site. Other treatment and disposal units include:

Stabilization 1.1 million tons
Other Disposal 25 thousand tons
Sludge treatment 20 thousand tons

A comparison of the management profile for all wastes and for wastes received from off-site shows that wastes managed off-site are managed differently. Most wastes managed on-site were managed in Deepwell/Underground Injection. The majority of wastes received from off-site were managed by Fuel Blending, Stabilization, or Landfill.

3.0 SHIPMENTS AND RECEIPTS

The following section provides an overview of the 1997 RCRA hazardous waste shipping⁷ and receiving data through a series of exhibits and textual summaries. For a complete description of this section's contents, please refer to the *Executive Summary* sections entitled "RCRA Hazardous Waste" and "RCRA Hazardous Waste Shipments and Receipts."

In 1997, 18,029 shippers reported shipping (either within the State or between States) 7.3 million tons of RCRA hazardous waste. When comparing the 1995 National Biennial Report with the 1997 Report, the number of shippers decreased by 2,468, and the quantity of waste shipped decreased by 3.3 million tons or 31%. Some of the decrease in the quantity of waste shipped may be attributable to the exclusion of wastewaters from the 1997 National Biennial Report data. However, since wastewaters are typically managed on-site rather than shipped off-site for management, the decrease between 1995 and 1997 is more likely the result of other factors. For a more detailed description of the wastewater exclusion, please refer to the section of the *Executive Summary* entitled "Changes to 1997 Biennial Reporting Requirements and the Biennial Report Data Presented in this Report."

The wastewater exclusion will make cursory comparisons between the 1997 National Biennial Report and earlier National Reports misleading. To facilitate an accurate comparison, Appendix B of this Report provides the 1995 National Report data *excluding wastewater* (i.e., the data was compiled using the same national reporting logic used to exclude wastewater data from the 1997 National Biennial Report). As presented in Exhibit B.3, 6.2 million tons of non-wastewater wastes were shipped in 1995; therefore, a more accurate picture of the change in national hazardous waste shipments between 1995 and 1997 is a decrease of 1.1 million tons or 15%.

Exhibits 3.1, 3.2, and 3.3 present the quantity of waste shipped and the number of shippers *in each EPA Region*⁸. Region 5 reported the largest number of shippers (3,988) and also reported shipping the greatest amount of waste, 2.3 million tons or 31% of the national shipment total. Region 8 reported the fewest shippers (335), while shippers in Region 10 reported shipping the least amount of waste (147 thousand tons).

_

⁷ The term "shipment" refers to the physical transfer of waste from one facility to another. In some instances, waste is transferred within a physical location that has more than one EPA Identification Number. These waste transfers are treated as shipments.

Appendix A includes a list of States by EPA Region.

Exhibit 3.1 Number and Percentage of Hazardous Waste Shippers and Total RCRA Hazardous Waste Quantity Shipped, by EPA Region, 1997

| | HAZARDOUS WA | ASTE QUANTITY | SHIPP | PPERS | |

| TOTAL | 18,029 | 100.0 | 7,332,532 | 100.0 |

Exhibits 3.4, 3.5, and 3.6 present the quantity of RCRA hazardous waste shipped and the number of shippers *in each State*. New York reported the most shippers (1,856), followed by California (1,713), Ohio (1,165), Texas (1,155), Pennsylvania (1,009), Illinois (972), New Jersey (749), and Michigan (632). Shippers in these States constituted 51% of the total number of shippers. South Carolina reported no shippers or shipments in 1997. Texas reported shipping the most waste, 1 million tons or 14% of the national shipment total. Ohio (564 thousand tons), California (564 thousand tons), Michigan (541 thousand tons), Minnesota (425 thousand tons), Indiana (365 thousand tons), Pennsylvania (311 thousand tons), and Illinois (292 thousand tons) were also among the top States in quantity of waste shipped. Shippers in these States accounted for 56% of the national shipment total. The 50 largest shippers in the United States are presented in Exhibit 3.7, and their shipments accounted for 37% of the national shipment total in 1997.

Note: Column may not sum due to rounding.

In 1997, 543 TSDs reported receiving 8 million tons of RCRA hazardous waste. When comparing the 1995 National Biennial Report with the 1997 Report, the number of TSDs receiving waste dropped by 101, and the quantity of waste received decreased by 1.3 million tons or 14%. Some of the decrease in the quantity of waste received may be attributable to the exclusion of wastewaters from the 1997 National Biennial Report data. However, since wastewaters are typically managed on-site rather than shipped off-site for management, the decrease between 1995 and 1997 is more likely the result of other factors.

The wastewater exclusion will make cursory comparisons between the 1997 National Biennial Report and earlier National Reports misleading. To facilitate an accurate comparison, Appendix B of this Report provides the 1995 National Report data *excluding wastewater* (i.e., the data was compiled using the same national reporting logic used to exclude wastewater data from the 1997 National Biennial Report). As presented in Exhibit B.4, 7.9 million tons of non-wastewater wastes were received by TSDs in 1995; therefore, a more accurate picture of the change in national hazardous waste receipts between 1995 and 1997 is an increase of 87 thousand tons or 1%.

Exhibits 3.8, 3.9, and 3.10 present the quantity of RCRA hazardous waste received and the number of receivers *in each EPA Region*. Region 5 reported the most receiving facilities (109), and these facilities also received the most waste (2.6 million tons, or 32% of the national receipt total). Region 1 reported receiving the least amount of waste (100 thousand tons), while Region 10 reported the fewest receivers (21).

Exhibits 3.11, 3.12, and 3.13 present the quantity of RCRA hazardous waste received (both from within and from outside of the State) and the number of receivers *in each State*. California reported the most receivers (50), followed by Texas (41), Pennsylvania (30), New York (26), Ohio (25), Florida (21), Indiana (21), Illinois (20), Michigan (20), and Missouri (20). Receivers in these States constituted 50% of the total number of receivers. California also reported receiving the largest quantity of waste (1.5 million tons), followed by Michigan (733 thousand tons), Ohio (693 thousand tons), Indiana (611 thousand tons), Texas (513 thousand tons), Pennsylvania (447 thousand tons), South Carolina (413 thousand tons), and Illinois (355 thousand tons). Receivers from these States accounted for 66% of the national waste receipt total. Eight (8) States reported they did not have any TSDs that received hazardous waste in 1997: the District of Columbia, Guam, Montana, the Navajo Nation, New Hampshire, the Trust Territories, the Virgin Islands, and Wyoming.

Exhibit 3.14 presents the 50 largest RCRA hazardous waste receivers in the United States for 1997. The TSDs on this list received 68% of all waste received in 1997.

As a cursory comparison of the shipment and receipt data reveals, the total quantity of waste reported shipped in 1997 is 664 thousand tons less than the total quantity received. The *Executive Summary* section entitled "RCRA Hazardous Waste Shipments and Receipts" provides an explanation for the discrepancies between the amount of waste reported shipped and the amount reported received.

Changes to the 1997 Biennial Reporting requirements will make cursory comparisons of the 1997 National Biennial Report to earlier National Biennial Reports misleading. Refer to the Executive Summary (ES-2) for a complete explanation.

4.0 IMPORTS AND EXPORTS

The following section provides an overview of the 1997 RCRA hazardous waste imports and exports data through exhibits and textual summaries. Only those quantities of waste that enter or leave the State are included in this category. For a complete description of this section's contents, please refer to the *Executive Summary* sections entitled "RCRA Hazardous Waste" and "RCRA Hazardous Waste Shipments and Receipts."

Of the 8 million tons of RCRA hazardous waste received in 1997, 4 million tons of waste were imported from other States. This is a 1.9 million ton or 32% decrease when compared to the 1995 National Biennial Report. Of the 7.3 million tons of RCRA hazardous waste shipped in 1997, 4.4 million tons of waste were exported to other States. This reflects a 924 thousand ton or 17% decline in exports when compared to the 1995 National Biennial Report. Some of the decrease in the quantity of waste imported or exported may be attributable to the exclusion of wastewaters from the 1997 National Biennial Report data. However, since wastewaters are typically managed on-site rather than shipped off-site for management, the decrease is more likely the result of other factors. For a more detailed description of the wastewater exclusion, please refer to the section of the *Executive Summary* entitled "Changes to the 1997 Biennial Reporting Requirements and the National Biennial Report Data Presented in this Report."

The wastewater exclusion will make cursory comparisons between the 1997 National Biennial Report and earlier National Reports misleading. To facilitate an accurate comparison, Appendix B of this Report provides the 1995 National Report data *excluding wastewater* (i.e., the data was compiled using the same national reporting logic used to exclude wastewater data from the 1997 National Biennial Report). As presented in Exhibit B.5, 5.1 million tons of non-wastewater wastes were imported from other States in 1995; therefore, a more accurate picture of the change in national hazardous waste imports between 1995 and 1997 is a decrease of 1.1 million tons or 22%. Likewise, as presented in Exhibit B.5, 3.6 million tons of non-wastewater wastes were exported to other States in 1995; therefore, a more accurate picture of the change in national hazardous waste exports between 1995 and 1997 is an increase of 753 thousand tons or 17%.

Exhibit 4.1 presents the quantity of RCRA hazardous waste imported and exported *by each EPA Region*¹. Receivers in Region 5 reported importing the largest quantity of waste (1.3 million tons), and shippers in the Region also exported the most waste (1.3 million tons). Receivers in Region 1 reported receiving the least amount of waste from out-of-State (54 thousand tons), while shippers in Region 8 reported exporting the least (86 thousand tons).

Exhibit 4.1 RCRA Hazardous Waste Imports and Exports, by EPA Region, 1997

| EPA REGION | IMPORTS (TONS) | EXPORTS (TONS) |
|------------|-------------------|-------------------|
| 1 | 53,795 | 189,339 |
| 2 | 127,506 | 332,839 |
| 3 | 367,435 | 465,576 |

| 10 | 121,828 | 114,787 |
| CBI DATA | 0 | 201 |
| TOTAL | 3,980,773 | 4,393,660 |

Note: Columns may not sum due to rounding.

Exhibit 4.2 presents the quantity of RCRA hazardous waste imported and exported *by each State*. The five (5) States whose TSDs reported importing the most hazardous waste were Ohio (428 thousand tons), Michigan (394 thousand tons), South Carolina (316 thousand tons), Pennsylvania (309 thousand tons), California (270 thousand tons), Indiana (235 thousand tons), and Missouri (195 thousand tons). The TSDs in these States imported 54% of the national total of waste imports. Eleven (11) States reported they did not have any TSDs that imported waste in 1997: Alaska, the District of Columbia, Guam, Maine, Montana, the Navajo Nation, New Hampshire, New Mexico, the Trust Territories, the Virgin Islands, and Wyoming.

_

Appendix A includes a list of States by EPA Region.

Note: Columns may not sum due to rounding.

The five (5) States whose shippers reported exporting the most hazardous waste were Minnesota (412 thousand tons), Ohio (313 thousand tons), Georgia (250 thousand tons), Texas (228 thousand tons), California (207 thousand tons), Illinois (206 thousand tons), Arkansas (203 thousand tons), Pennsylvania (191 thousand tons), and Michigan (189 thousand tons). The exports from these five (5) States accounted for 50% of the national total of hazardous waste exports. South Carolina reported they did not have any shippers that exported waste in 1997.

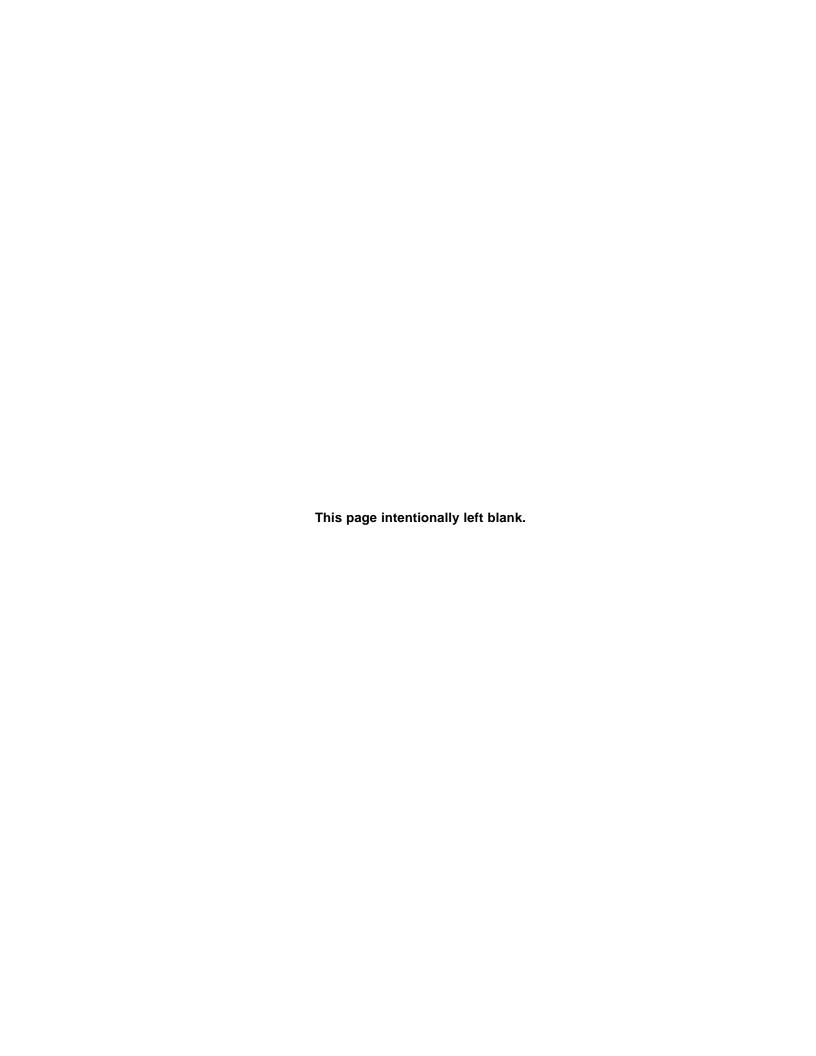

As a cursory comparison of the import and export data reveals, the total quantity of waste reported imported in 1997 is 413 thousand tons less than the total quantity exported. The *Executive Summary* section entitled "RCRA Hazardous Waste Shipments and Receipts" provides an explanation for the discrepancies between the amount of waste reported shipped and the amount reported received.

APPENDIX B

1995 NATIONAL BIENNIAL REPORT DATA USING 1997 NATIONAL REPORTING LOGIC

Appendix B provides the 1995 National Biennial Report data excluding wastewater (i.e., the data was compiled using the same national reporting logic used to exclude wastewater data from the 1997 National Report). Because the wastewater exclusion will make cursory comparisons between the 1997 National Biennial Report and earlier National Reports misleading, EPA is providing the 1995 BRS data in this format to facilitate an accurate comparison of the changes in generation, management, shipping, receiving, and imports and exports between the 1995 and 1997 biennial reporting cycles. For a more detailed description of the wastewater exclusion, please refer to the section of the *Executive Summary* entitled "Changes to 1997 Biennial Reporting Requirements and the National Biennial Report Data Presented in this Report."

APPENDIX D

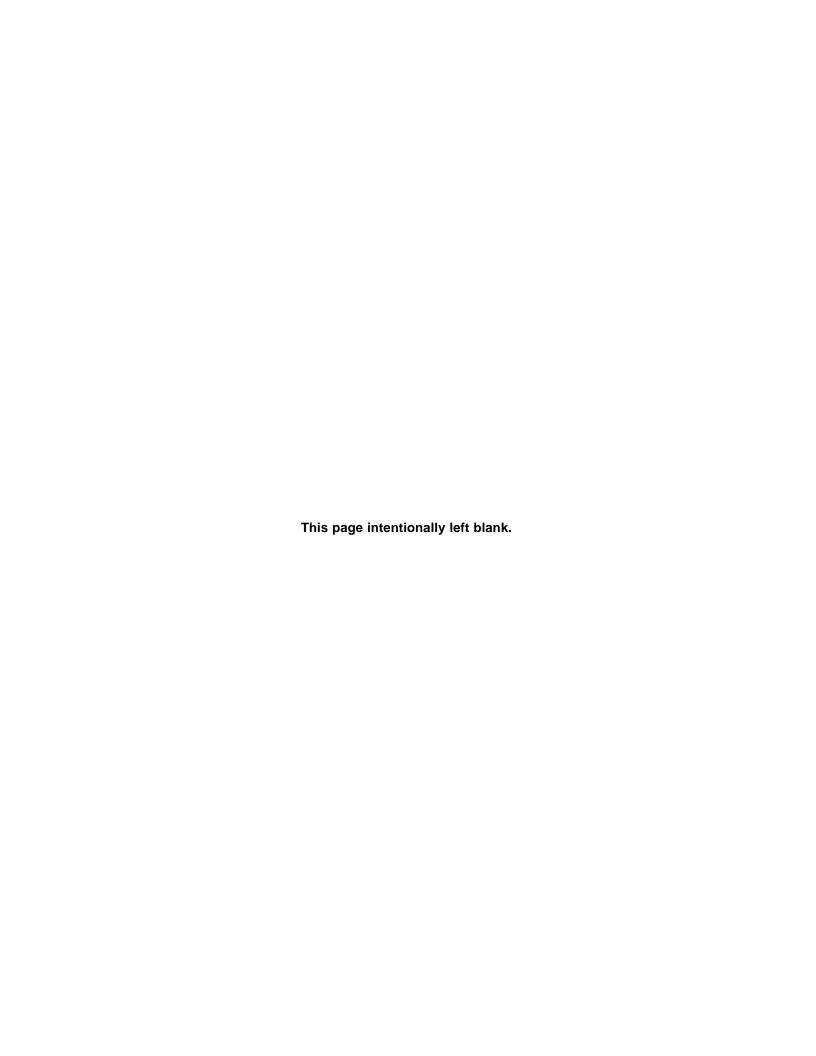

1997 HAZARDOUS WASTE REPORT FORM CODES

| Code System Type | Code System Type |
|---|--|
| LAB PACKS | <u>LIQUIDS</u> (cont'd) |
| LAB PACKS - Lab packs of mixed wastes, chemicals, lab wastes | ORGANIC LIQUIDS - Waste that is primarily organic and is highly fluid, with low inorganic solids content and low-to-moderate water content |
| B001 Lab packs of old chemicals only B002 Lab packs of debris only B003 Mixed lab packs B004 Lab packs containing acute hazardous wastes B009 Other lab packs (Specify in Comments) LIQUIDS | B201 Concentrated solvent-water solution B202 Halogenated (e.g., chlorinated) solvent B203 Nonhalogenated solvent B204 Halogenated/nonhalogenated solvent mixture B205 Oil-water emulsion or mixture B206 Waste oil |
| INORGANIC LIQUIDS - Waste that is primarily inorganic and highly fluid (e.g., aqueous), with low suspended inorganic solids and low organic content | B207 Concentrated aqueous solution of other organics B208 Concentrated phenolics B209 Organic paint, ink, lacquer, or varnish B210 Adhesives or epoxies B211 Paint thinner or petroleum distillates |
| B101 Aqueous waste with low solvents B102 Aqueous waste with low other toxic organics B103 Spent acid with metals B104 Spent acid without metals | B212 Reactive or polymerizable organic liquid B219 Other organic liquids (Specify in Comments) |
| B105 Acidic aqueous waste B106 Caustic solution with metals but no cyanides B107 Caustic solution with metals and cyanides B108 Caustic solution with cyanides but no metals B109 Spent caustic | SOLIDS INORGANIC SOLIDS - Waste that is primarily inorganic and solid, with low organic content and low-to-moderate water content; not pumpable |
| B110 Caustic aqueous waste B111 Aqueous waste with reactive sulfides B112 Aqueous waste with other reactives (e.g., explosives) B113 Other aqueous waste with high dissolved solids B114 Other aqueous waste with low dissolved solids B115 Scrubber water | B301 Soil contaminated with organics B302 Soil contaminated with inorganics only B303 Ash, slag, or other residue from incineration of wastes B304 Other "dry" ash, slag, or thermal residue B305 "Dry" lime or metal hydroxide solids chemically "fixed" |
| B116 Leachate B117 Waste liquid mercury B119 Other inorganic liquids (Specify in Comments) | B306 "Dry" lime or metal hydroxide solids not "fixed" B307 Metal scale, filings, or scrap B308 Empty or crushed metal drums or containers B309 Batteries or battery parts, casings, cores B310 Spent solid filters or adsorbents B311 Asbestos solids and debris B312 Metal-cyanide salts/chemicals B313 Reactive cyanide salts/chemicals B314 Reactive sulfide salts/chemicals B315 Other reactive salts/chemicals B316 Other metal salts/chemicals B319 Other waste inorganic solids (Specify in Comments) |

| Code System Type | Code System Type |
|---|--|
| SOLIDS (cont'd) | SLUDGES (cont'd) |
| ORGANIC SOLIDS - Waste that is primarily organic and solid, with low-to-moderate inorganic content and water content; not pumpable | ORGANIC SLUDGES - Waste that is primarily organic with low-to-moderate inorganic solids content and water content, and pumpable |
| B401 Halogenated pesticide solid B402 Nonhalogenated pesticide solid B403 Solid resins or polymerized organics B404 Spent carbon B405 Reactive organic solid B406 Empty fiber or plastic containers B407 Other halogenated organic solids (Specify in Comments) B409 Other nonhalogenated organic solids (Specify in Comments) | B601 Still bottoms of halogenated (e.g., chlorinated) solvents or other organic liquids B602 Still bottoms of nonhalogenated solvents or other organic liquids B603 Oily sludge B604 Organic paint or ink sludge B605 Reactive or polymerizable organics B606 Resins, tars, or tarry sludge B607 Biological treatment sludge B608 Sewage or other untreated biological sludge B609 Other organic sludges (Specify in Comments) |
| <u>SLUDGES</u> | <u>GASES</u> |
| INORGANIC SLUDGES - Waste that is primarily inorganic, with moderate-to-high water content and low organic content, and pumpable | INORGANIC GASES - Waste that is primarily inorganic with a low organic content and is a gas at atmospheric pressure |
| B501 Lime sludge without metals B502 Lime sludge with metals/metal hydroxide sludge B503 Wastewater treatment sludge with toxic organics B504 Other wastewater treatment sludge B505 Untreated plating sludge without cyanides B506 Untreated plating sludge with cyanides B507 Other sludge with cyanides B508 Sludge with reactive sulfides B509 Sludge with other reactives B510 Degreasing sludge with metal scale or filings B511 Air pollution control device sludge (e.g., fly ash, wet scrubber sludge) B512 Sediment or lagoon dragout contaminated with organics B513 Sediment or lagoon dragout contaminated with inorganics only B514 Drilling mud B515 Asbestos slurry or sludge | ORGANIC GASES - Waste that is primarily organic with low-to-moderate inorganic content and is a gas at atmospheric pressure B801 Organic gases |
| B516 Chloride or other brine sludgeB519 Other inorganic sludges (Specify in Comments) | |

isobutanol, pyridine, benzene, 2-ethoxyethanol,

mixtures/blends containing, before use, a total of

ten percent or more (by volume) of one or more of

bottoms from the recovery of these spent solvents

the above nonhalogenated solvents or those

solvents listed in F001, F002, or F004; and still

F005 The following spent nonhalogenated solvents:

and 2-nitropropane; all spent solvent

and spent solvent mixtures.

solvent mixtures.

EPA HAZARDOUS WASTE CODES

Waste description Code Waste description Code **F002** The following spent halogenated solvents: F006 Wastewater treatment sludges from electroplating tetrachloroethylene, methylene chloride, operations except from the following processes: (1) trichloroethylene, 1,1,1-trichloroethane, sulfuric acid anodizing of aluminum; (2) tin plating on chlorobenzene, 1,1,2-trichloro-1,2,2carbon steel; (3) zinc plating (segregated basis) on trifluoroethane, ortho-dichlorobenzene. carbon steel: (4) aluminum or zinc-aluminum plating on trichlorofluoromethane, and 1,1,2, trichloroethane; carbon steel; (5) cleaning/stripping associated with tin, all spent solvent mixtures/blends containing, zinc, and aluminum plating on carbon steel; and (6) chemical etching and milling of aluminum. before use, a total of ten percent or more (by volume) of one or more of the above halogenated solvents or those solvents listed in F001, F004, F007 Spent cyanide plating bath solutions from and F005; and still bottoms from the recovery of electroplating operations. these spent solvents and spent solvent mixtures. Plating bath residues from the bottom of plating baths F008 **F003** The following spent non-halogenated solvents: from electroplating operations in which cyanides are xylene, acetone, ethyl acetate, ethyl benzene, used in the process. ethyl ether, methyl isobutyl ketone, n-butyl alcohol, cyclohexanone, and methanol; all spent F009 Spent stripping and cleaning bath solutions from solvent mixtures/ blends containing, before use, electroplating operations in which cyanides are used in only the above spent nonhalogenated solvents; the process. and all spent solvent mixtures/blends containing, Quenching bath residues from oil baths from metal heat before use, one or more of the above F010 nonhalogenated solvents, and a total of ten treating operations in which cyanides are used in the percent or more (by volume) of one or more of process. those solvents listed in F001, F002, F004, and F011 F005; and still bottoms from the recovery of these Spent cyanide solutions from slat bath pot cleaning spent solvents and spent solvent mixtures. from metal heat treating operations. **F004** The following spent nonhalogenated solvents: F012 Quenching wastewater treatment sludges from metal cresols, cresylic acid, and nitrobenzene; and the heat treating operations in which cyanides are used in still bottoms from the recovery of these solvents; the process. all spent solvent mixtures/blends containing, before use, a total of ten percent or more (by F019 Wastewater treatment sludges from the chemical volume) of one or more of the above nonhalogenated solvents or those solvents listed

- conversion coating of aluminum except from zirconium phosphating in aluminum can washing when such phosphating is an exclusive conversion coating process.
- Wastes (except wastewater and spent carbon from F020 hydrogen chloride purification) from the production or manufacturing use (as a reactant, chemical intermediate, or component in a formulating process) of tri- or tetrachlorophenol or of intermediates used to produce their pesticide derivatives. (This listing does not include wastes from the production of hexachlorophene from highly purified 2,4,5trichlorophenol.)
- F021 Wastes (except wastewater and spent carbon from hydrogen chloride purification) from the production or manufacturing use (as a reactant, chemical intermediate, or component in a formulating process) of pentachlorophenol, or of intermediates used to produce derivatives.

F022 Wastes (except wastewater and spent carbon from hydrogen chloride purification) from the

Waste description

Code

manufacturing use (as a reactant, chemical intermediate, or component in a formulating process) of tetra-, penta-, or hexachlorobenzenes under alkaline conditions.

F023 Wastes (except wastewater and spent carbon from hydrogen chloride purification) from the production of materials on equipment previously used for the production or manufacturing use (as a reactant, chemical intermediate, or component in a formulating process) of tri- and tetrachlorophenols. (This listing does not include wastes from equipment used only for the production or use of hexachlorophene from highly purified 2,4,5-trichlorophenol.)

F024 Process wastes including, but not limited to, distillation residues, heavy ends, tars, and reactor clean-out wastes, from the production of certain chlorinated aliphatic hydrocarbons by free radical catalyzed processes. These chlorinated aliphatic hydrocarbons are those having carbon chain lengths ranging from one to and including five, with varying amounts and positions of chlorine substitution. (This listing does not include wastewaters, wastewater treatment sludge, spent catalysts, and wastes listed in Sections 261.31. or 261.32.)

F025 Condensed light ends, spent filters and filter aids, and spent desiccant wastes from the production of certain chlorinated aliphatic hydrocarbons, by free radical catalyzed processes. These chlorinated aliphatic hydrocarbons are those having carbon chain lengths ranging from one, to and including five, with varying amounts and positions of chlorine substitution.

F026 Wastes (except wastewater and spent carbon from hydrogen chloride purification) from the production of materials on equipment previously used for the manufacturing use (as a reactant, chemical intermediate, or component in a formulating process) of tetra-, penta-, or hexachlorobenzene under alkaline conditions.

F027 Discarded unused formulations containing tri-, tetra-, or pentachlorophenol or discarded unused formulations containing compounds derived from these

chlorophenols. (This listing does not include formulations containing hexachlorophene synthesized from prepurified 2,4,5-trichlorophenol as the sole component.)

Waste description

F028 Residues resulting from the incineration or thermal treatment of soil contaminated with EPA hazardous waste nos. F020, F021, F022, F023, F026, and F027.

Wastewaters, process residuals, preservative drippage, F032 and spent formulations from wood preserving processes generated at plants that currently use, or have previously used, chlorophenolic formulations [except potentially cross-contaminated wastes that have had the F032 waste code deleted in accordance with Section 261.35 (i.e., the newly promulgated equipment cleaning or replacement standards), and where the generator does not resume or initiate use of chlorophenolic formulations]. (This listing does not include K001 bottom sediment sludge from the treatment of wastewater from wood preserving processes that use creosote and/or pentachlorophenol.)

F034 Wastewaters, process residuals, preservative drippage, and spent formulations from wood preserving processes generated at plants that use creosote formulations. This listing does not include K001 bottom sediment sludge from the treatment of wastewater from wood preserving processes that use creosote and/or pentachlorophenol.

Wastewaters, process residuals, preservative drippage, F035 and spent formulations from wood preserving processes generated at plants that use inorganic preservatives containing arsenic or chromium. This listing does not include K001 bottom sediment sludge from the treatment of wastewater from wood preserving processes that use creosote and/or pentachlorophenol.
